AI CAREERS FOR WOMEN

LINKEDIN FELLOWSHIP

Smart bank insights:AI Powered Banking analytics using Power BI and Copliot

---

Project Domain

Power BI with Copilot

A Collaborative Initiative

equipping students with practical skills in AI, Data Analytics, and Business Intelligence

Institution:

Graphic Era Hill University

Year - 2026

3. Problem Statement

Banks collect large amounts of customer data, but they often struggle to convert this data into meaningful insights for improving customer satisfaction, retention, and profitability. There is a need to analyze banking customer data to understand customer behavior, financial health, account usage patterns, and risk levels. In the real-world context, analyzing banking data is very important because inaccurate or poorly managed data can lead to incorrect financial reports and poor decision-making within organizations. However, even though tools like Excel are widely used, there is still a gap in effectively analyzing large datasets and generating meaningful insights, especially when modern technologies like artificial intelligence are not fully utilized. This project aims to address this gap by using modern analytical tools such as Excel with AI assistance to improve data analysis. The problem mainly affects bank managers, financial analysts, and operational staff who rely on accurate data for decision-making, and the solution can provide value by improving efficiency, reducing errors, and helping organizations make better data-driven financial decision.

4. Objectives

4. Objectives

List the specific goals your project aims to accomplish. Objectives should be clear and measurable

- To collect and explore the raw dataset, understand its structure, fields, and data quality issues.
- To clean and preprocess the data by removing duplicates, handling missing values, correcting formats, and standardizing fields.
- To apply domain-relevant analysis using the assigned tool (Excel formulas and pivot tables, Power BI measures, or AI prompt techniques).
- To build an interactive dashboard, structured report, or AI-generated output that communicates insights clearly to stakeholders.
- To integrate AI tools (Microsoft Copilot or AI Chatbot) to automate, enhance, or accelerate the analysis and content generation process.
- To document the complete project process, upload all files to GitHub, and record a demonstration video for submission.

5. Methodology / Implementation Plan

Provide a simple overview of how the project will be carried out. The following five-phase workflow applies to all projects under this fellowship program.

#	Phase	Description
1	**Data Collection & Exploration**	Obtain the raw dataset (CSV / Excel) from Kaggle , . their were total 19 field name i.e full name user name,account type, country, city,age etc. The data type is of text,numeric,date/text format, and row count is around of1500.
2	**Data Cleaning & Preprocessing**	Remove duplicates, handle null or missing values, fix incorrect data types, and standardize date and text formats using Excel (Remove Duplicates, IF, IFERROR,)

3	**Analysis & AI Integration**	Use pivot tables for demographic analysis, Excel formulas(SUMIF,UPPER,IF,COUNT) and power tools charts-etc.
4	**Visualization / Output**	Use of pivot tabel in excel and charts in Power BI.
5	**Documentation & Submission**	Write the project report, upload all files to a GitHub repository, and record a video demonstration. Submit the GitHub link, video link, and dashboard link (if applicable) for evaluation.**Not yet done**

6. Resources and Timeline

A. Hardware & Software Requirements

- Laptop or PC — Intel Core i3 or higher, minimum 4 GB RAM (8 GB recommended)
- Operating System: Windows 10 / 11 or macOS
- Microsoft Excel (Microsoft 365 / Excel 2019 or later)
- Power BI Desktop — latest version (free download from Microsoft) — where applicable
- Microsoft Copilot — via Microsoft 365 subscription — where applicable
- AI Chatbot (ChatGPT / Google Gemini / Microsoft Copilot Web) — for prompt-based projects
- Internet connection — required for Copilot and AI Chatbot access
- Web browser — Google Chrome or Microsoft Edge (latest version)

B. Dataset

• The dataset is already available on kaggle,The data set contains information related to banking customer and their financial activities It includes fields like customer id,age, gender, income level,etc .the data helped analyse customer financial behaviour transaction etc .
• Source link of dataset:-https://www.kaggle.com/datasets/realzippo/global-banking-customer-analytics-dataset.
• For AI prompt :-1."Analyse the banking customer at a certain identify key financial tag such as average balance transaction pattern ".Outcome(The copilot will generate the summary of the major financial patent data set helping to identify customer financial behaviour trends.
• For AI prompt:- 2"Provide the insight from the data set about with customer group

hair balance and better loan approval rates ".Outcomes(Cooper identify customer segments with the stronger financial health based on their factor like income level, credit score, age).

7. Expected Outcomes / Conclusion

This section summarizes what the team expects to deliver by the end of the project. Outcomes should be realistic and directly tied to the objectives stated above.

- A clean, And well stated Banking dataset after datapooshing
- An interactive excel dashboard that helps to visualise the important banking insides like gender wise analysis, country wise, risk category etc
- Microsoft Copilot Will be used to analyse banking data set and insight from the data.
- Prompt will be given to copied to identify financial trains such as average balances, loan approval patterns and the transaction behaviour.For example"Analyse banking customer asset and summarise the key financial pattern"-Output Result(Customer with higher income levels maintain higher average account balances and loan approval are more common among customers with higher credit score).
